Air2App

Marine monitoring and control system

The HarborAlert boat monitoring and control system from Air2App provides up to date information about your boat's mechanical and electrical systems and reports it to a local PC at your marina or yacht club. Through the use of a wireless network connection HarborAlert can monitor your boats battery voltage, engine hours, maintenance, shore power connection, ignition engaged, bilge pump, alarms and boat security. HarborAlert can also notify the marina of your arrival or departure in real time. An additional feature allows items like cabin lighting, heating, or AC to be remotely operated by you or the Marina. Your boat can also be monitored through the HarborAlert Operations Center 24 hours a day, 7 days a week. Alarm conditions can be reported via E-mail, Text Messaging, Fax or Voice notification to any number of users. Simple installation gets your boat protected quickly for peace of mind. HarborAlert will also monitor your boat when visiting any participating marina or yacht club.
